# 数据结构

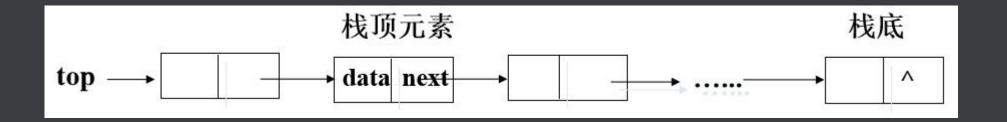

链式栈

创客学院 小美老师

### 链式栈

插入操作和删除操作均在链表头部进行,链表尾部就是栈底,栈顶指针就是头指针。

```
typedef int data_t; /*定义栈中数据元素数据类型*/
typedef struct node_t {
   data_t data; /*数据域*/
   struct node_t *next; /*链接指针域*/
} linkstack t; /*链栈类型定义*/
```

### 栈

```
创建空栈:
   linkstack t *CreateLinkstack() {
     linkstack_t *top;
     top = (linkstack t *)malloc(sizeof(linkstack t));
     top->next = NULL;
     return top;
判断是否空栈:
  int EmptyStack (linkstack_t *top)
       return (top->next == NULL ? 1 : 0);
```

#### 栈

#### 入栈:

```
void PushStack(linkstack_t *top, data_t x)
linkstack_t *p;
p = (linkstack_t *)malloc ( sizeof (linkstack_t) );
p->data = x;
p->next = top->next;
top->next = p;
return;
```
